DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance:

Applicant's claimed invention is deemed allowable over the prior art of record as the prior art fails to teach or suggest a power control unit for generating signals determining whether to supply clocks and power to the respective blocks of the media access controller, in response to the control signal of the bus arbiter, the register values inputted via the local bus, and a power-save mode exiting signal provided from other blocks of the media access controller in combination with other limitations as recited in independent claim and further in view of the specification. As per Amos' reference (US Patent 6,34,870) discloses the MAC is able to utilize a bus clock to process data on the bus card. It provides a control signal to the selection low or high frequency clocks or switch to sleep mode until either the timer expires or additional bus activity is required(col.2, line 61-col.3, line 26). Where as Yik et al. (Pub No. US2003/0226050)'s reference discloses the MAC controller switch from the power-savings mode to the run mode in response to event signal (paragraph 15). Neither alone or combination of the prior arts teach a power control unit for generating signals determining whether to supply clocks and power to the respective blocks of the media access controller in response to the control signal of the bus arbiter and the register values inputted via the local bus in combination with other limitations as recited in independent claim.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
